

AIIMS CRE OT Technician (Part 12)

Video Analysis & Practice Questions

Important Note from the Video Analysis:

The YouTube video provided ("*AIIMS CRE OT TECHNICIAN QUESTION PAPER 2025*") **does not contain any actual Multiple Choice Questions (MCQs)**. Instead, the creator explicitly states that AIIMS does not release official previous year question papers. The video is focused on explaining the exam pattern, the increase in vacancies, and promoting a test series.

To fulfill your request for exam preparation, I have summarized the exam strategy discussed in the video and provided **sample high-yield MCQs** relevant to the AIIMS CRE Anesthesia/OT Technician post.

Video Content Summary: Exam Pattern & Strategy

- **Vacancies:** Increased from 267 to 338 for Post Code 11 (OT Assistant/Technician).
- **Exam Pattern:** Total 100 questions for 400 marks.
- **Duration:** 90 minutes.
- **Negative Marking:** 0.25 marks deducted for each wrong answer.
- **Target Score:** Suggested safe target is 270+ marks to secure a post.
- **Sections:** The General Part consists of 20 questions (Math, Reasoning, GK, Computer), and the core OT/Anesthesia subject part consists of 80 questions.
- **Strategy:** The video emphasizes time management, mock tests, and states that exact previous year papers are unavailable.

Sample Anesthesia/OT Technician MCQs (Bonus for Exam Prep)

1. The color code for a Nitrous Oxide (N₂O) cylinder is:

- A) Black with white shoulders
- B) French Blue
- C) Grey
- D) White

Answer: B) French Blue

Explanation: In medical gas cylinders, standard color coding is crucial for safety to prevent administering the wrong gas. Nitrous oxide cylinders are universally painted French Blue. Oxygen cylinders are black with white shoulders, Carbon dioxide is grey, and medical air is typically black with white and black quarters on the shoulder (or completely yellow in the US).

2. Which of the following is a depolarizing muscle relaxant used in general anesthesia?

- A) Rocuronium
- B) Vecuronium
- C) Succinylcholine
- D) Atracurium

Answer: C) Succinylcholine

Explanation: Succinylcholine is the only depolarizing neuromuscular blocker commonly used in clinical practice. It acts by mimicking acetylcholine, binding to the receptor and causing prolonged depolarization, leading to muscle relaxation. The others (Rocuronium, Vecuronium, Atracurium) are non-depolarizing agents.

3. The most reliable method to confirm correct endotracheal tube placement is:

- A) Chest movement visualization
- B) Auscultation of breath sounds
- C) Pulse oximetry
- D) Continuous capnography (EtCO₂)

Answer: D) Continuous capnography (EtCO₂)

Explanation: While visualizing chest rise and auscultation are important initial steps, continuous waveform capnography (measuring end-tidal CO₂) is the gold standard and most reliable method to confirm and monitor correct placement of an endotracheal tube in the trachea.

4. What is the standard temperature settings for an Operation Theatre (OT)?

- A) 15-18°C
- B) 20-24°C
- C) 25-28°C
- D) 30-32°C

Answer: B) 20-24°C

Explanation: The standard temperature range for an operation theatre is usually maintained between 20°C and 24°C (68°F to 75°F). This range provides a balance between preventing patient hypothermia and maintaining comfort for the surgical team wearing heavy gowns. Humidity is typically kept between 30% and 60%.

5. Which sterilization method is typically used for heat-sensitive endoscopic instruments?

- A) Autoclaving (Steam under pressure)
- B) Hot air oven
- C) Ethylene Oxide (EtO) gas or Plasma sterilization
- D) Boiling water

Answer: C) Ethylene Oxide (EtO) gas or Plasma sterilization

Explanation: Heat-sensitive items like flexible endoscopes and certain plastics would melt or degrade under the high temperatures of autoclaving or a hot air oven. Ethylene oxide gas and hydrogen peroxide plasma are effective low-temperature sterilization methods used for these delicate instruments.
